Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (previously presented) A configurable circuit arrangement comprising at least one circuit component at which a load is applied that can vary during operation of said circuit arrangement, wherein said configurable circuit arrangement comprises:

load determination means for determining a load applied at said at least one configurable circuit component having different fan-in or fan-out depending on a configuration of said circuit arrangement; and

adjusting means for switching off a buffer connected to the configurable circuit according to the determination of the applied load, wherein switching off the buffer adjusts a drive capacity of said at least one circuit component to a value less than a maximum drive capacity while still meeting a delay specification.

- 2. (previously presented) A circuit arrangement according to claim 1, wherein said determination means is configured to determine said load based on a configuration information loaded to said circuit arrangement.
- 3. (previously presented) A circuit arrangement according to claim 2, wherein said configuration information is stored in a configuration memory.
- 4. (previously presented) A circuit arrangement according to claim 2, wherein said configuration information comprises a configuration bit stream defining at least one of an input load and an output load of said at least one component.
- 5. (canceled)

6. (canceled)

7. (previously presented) A circuit arrangement according to claim 1, wherein said

adjusting means is adapted to generate at least one control signal for simultaneously

switching off a section of buffers.

8. (previously presented) A circuit arrangement according to claim 7, wherein said

adjusting means is adapted to derive said control signal from a most significant bit signal

of a selection signal obtained from said determination means.

9. (previously presented) A circuit arrangement according to claim 1, wherein said

adjusting means is configured to vary a threshold voltage of circuit elements of said

circuit arrangement.

10. (previously presented) A circuit arrangement according to claim 9, wherein said

adjusting means is adapted to change at least one bias voltage responsive to said

determination means.

11. (previously presented) A circuit arrangement according to claim 1, wherein said

circuit arrangement is a field programmable gate array device.

12. (previously presented) A method of controlling power consumption of a

configurable circuit arrangement, said method comprising the steps of:

determining a load applied to at least one circuit component having different fan-

in or fan-out depending on a configuration of said configurable circuit arrangement; and

switching off a buffer connected to the configurable circuit according to the

determination of the applied load, wherein switching off the buffer adjusts a drive

capacity of said at least one circuit component responsive to said determination step to a

value less than a maximum drive capacity while still meeting a delay requirement.

Attorney Docket No. NL03 1474 US1 Serial No. 10/583,808

4

- 13. (previously presented) The method according to claim 12, further comprising simultaneously switching off a section of buffers.
- 14. (previously presented) The method according to claim 13, further comprising deriving said control signal from a most significant bit signal of a selection signal.
